

Assignment No.3:- Program to solve a fractional Knapsack problem using a greedy method

Name:-Sameer Narendra Tikare

Roll No:-COBB034

```
# Structure for an item which stores weight and
# corresponding value of Item
class Item:
    def __init__(self, value, weight):
        self.value = value
        self.weight = weight

# Main greedy function to solve problem
def fractionalKnapsack(W, arr):

    # sorting Item on basis of ratio
    arr.sort(key=lambda x: (x.value/x.weight), reverse=True)

    # Uncomment to see new order of Items with their
    # ratio
    # for item in arr:
    #     print(item.value, item.weight, item.value/item.weight)

    # Result(value in Knapsack)
    finalvalue = 0.0

    # Looping through all Items
    for item in arr:

        # If adding Item won't overflow, add it completely
        if item.weight <= W:
            W -= item.weight
            finalvalue += item.value

        # If we can't add current Item, add fractional part
        # of it
        else:
            finalvalue += item.value * W / item.weight
            break

    # Returning final value
    return finalvalue

# Driver's Code
if __name__ == "__main__":

    # Weight of Knapsack
    W = 50
    arr = [Item(60, 10), Item(100, 20), Item(120, 30)]
```

```
# Function call
max_val = fractionalKnapsack(W, arr)
print ('Maximum value we can obtain = {}'.format(max_val))
```

Output

The screenshot shows a Jupyter Notebook titled "Assignment 3.ipynb" in Visual Studio Code. The notebook is in "Restricted Mode" and contains a Python cell with the following code:

```
W = 50
arr = [Item(60, 10), Item(100, 20), Item(120, 30)]

# Function call
max_val = fractionalKnapsack(W, arr)
print ('Maximum value we can obtain = {}'.format(max_val))
```

The output of the cell is displayed below the code:

```
Maximum value we can obtain = 240.0
```

The bottom status bar indicates "Restricted Mode" and "Jupyter Server: local". The Windows taskbar at the bottom shows the time as 18:56 on 15-10-2022.
